

## Detail Elevation - Indoor Training Pitch

①

The proposed facade has been approached in such a way to promote uniformity across all buildings on the site by continuing to use a selected material palette. Timber effect cladding has been proposed as a primary material in a sensitivity reference to the Metropolitan Open Land (MOL) in which it sits. Recognising that the indoor pitch is a substantial introduction of mass to the site, much of the cladding above 3m is suggested as a translucent polycarbonate panel to promote a lightweight, transparent aesthetic to minimise the impact on the structure within the surrounding environment. A feature cladding panel is indicated in key reception/entrance areas of the site to introduce brand identity and cement the site's status as the home of CPFC.
